In the first 90 days of concurrent opioid and benzodiazepine use, the risk of opioid-related overdose increases five-fold compared to opioid-only use among Medicare recipients, according to a new study published in JAMA Network Open. The U.S. Centers for Disease Control and Prevention recommends against concurrent use of opioids and benzodiazepines, but nearly a quarter of Medicare recipients who are prescribed ipioids also fill prescriptions for benzodiazepines. Both drugs have sedative effects.

A drug used to treat altitude sickness-as well as glaucoma, epilepsy, heart failure and sizures-may also offer significant gains for patients with a fast-growing brain tumor known as glioblastoma, according to a study published July 4, 2018, in the journal Science Translational Medicine. The drug, acetazolamide, sold under the trade name Diamox, is easy to take and has limited side effects.

Researchers have shown- for the first time-that established lung fibrosis can be reversed using the diabetes drug Metformin. This finding, reported in the journal Nature Medicine, is important because, despite significant advances to reveal the pathological mechanisms of persistent fibrosis, effective treatment interventions are lacking. Pulmonary fibrosis can develop after lung injuries like infections, radiation or chemotherapy, or it can have an unknown cause, as in idiopathic pulmonary fibrosis, or IPF. IPF is a progressive, and ultimately fatal, lung disorder that strikes more then 150,000 patients a year in the United States and more than 5 million worldwide.
